Barnard's computer science community is growing. The number of Computer Science majors at Barnard has doubled over the last several years. Barnard's Computer Science program offers meaningful computing education and experiences to all Barnard students and partners with Columbia's Computer Science department to offer a major in Computer Science. The program aims to expand students' use and understanding of computation and data analysis across disciplines; offer students opportunities to think critically about the social implications of technology, including how to harness it for social good; promote curricular and pedagogical advances in computer science and its multidisciplinary applications; and provide new models for engaging students and enhancing diversity in computing.

**Chair:** Rebecca Wright (Druckenmiller Professor of Computer Science)

**Associate Professor:** Smaranda Muresan

**Assistant Professors:** Brian Plancher, Mark Santolucito, Lucy Simko, Corey Toler-Franklin, Tiffany Tseng

**Roman Family Teaching and Research Fellow:** Lisa Soros

The Department of Computer Science offers a major and a minor. See below for information on:

1. The New "Trackless" Major in Computer Science for Students Who Entered Barnard Fall 2023 or After (p. 1)
2. The Old "Track-based" Major in Computer Science for Students Who Entered Barnard Before Fall 2023 (p. 2)
3. Major in Mathematics-Computer Science
4. Minor in Computer Science (p. 3)

## Major in Computer Science for Students Who Entered Barnard Fall 2023 or After (p. 1):

As of Fall 2023, there is a new "trackless" version of the Computer Science curriculum. Students who joined Barnard before Fall 2023 will still follow the older, track-based CS curriculum (p. 2), though we can allow the new version as an exception.

To declare a major in Computer Science, submit a major declaration form via Slate.

The "trackless" Computer Science major consists of 14-15 courses (a minimum of 44 points) to be distributed as follows.

For a description of the joint Major in Mathematics–Computer Science, see [Mathematics](#).

**Minor in Computer Science**

Barnard students can declare a minor only once they have all of the required courses completed or in progress, and this must be done by March 1 of the senior year. Courses for the major and minor may not overlap. (The minor department chair can request an exception to this policy for a maximum of two overlapping courses if the minor requires more than 18 credits, the major requires more than 40 credits, and the overlapping courses are explicitly required for both.)

To declare Computer Science as a minor, submit a [minor declaration form](#) via Slate.

The Computer Science minor consists of the following six courses (a minimum of 19 points):

**COMS BC3159 Parallel Optimization for Robotics. 3.00 points.**

Many stages of state-of-the-art robotics pipelines rely on the solutions of underlying optimization algorithms. Unfortunately, many of these approaches rely on simplifications and conservative approximations in order to reduce their computational complexity and support online operation. At the same time, parallelism has been used to significantly increase the throughput of computationally expensive algorithms across the field of computer science. And, with the widespread adoption of parallel computing platforms such as GPUs, it is natural to consider whether these architectures can benefit robotics researchers interested in solving computationally constrained problems online. This course will provide students with an introduction to both parallel programming on CPUs and GPUs as well as optimization algorithms for robotics applications. It will then dive into the intersection of those fields through case studies of recent state-of-the-art research and culminate in a team-based final project

**COMS BC3420 PRIVACY IN A NETWORKED WORLD. 4.00 points.**

The ubiquity of computers and networks in business, government, recreation, and almost all aspects of daily life has led to a proliferation of online sensitive data: data that, if used improperly, can harm the data subjects. As a result, concern about the use, ownership, control, privacy, and accuracy of these data has become a top priority. This seminar course focuses on both the technical challenges of handling sensitive data, the privacy implications of various technologies, and the policy and legal issues facing data subjects, data owners, and data users

**COMS BC3430 Computational Sound. 3.00 points.**

In this course, we explore the variety of roles that computation can play in the analysis, creation, and performance of music. We start with the fundamentals of sound in the digital domain, covering issues of representation and audio synthesis. We then move through various synthesis techniques including the additive, subtractive, frequency modulation (FM), and amplitude modulation (AM) synthesis. After covering some core DSP techniques, we put these concepts into performative practice by exploring "live coding". In the space of live coding, we examine various programming language designs to understand how various domain specific languages (DSLs) support live coding. For the third module, we turn our focus to automated composition and analysis, addressing challenges in music information retrieval, generative art, and autonomous improvisation systems. All the while, we continue to develop our fluency in live coding by putting new topics to practice

An exploration of advanced machine learning tools for perception and behavior learning. How can machines perceive, learn from, and classify human activity computationally? Topics include appearance-based models, principal and independent components analysis, dimensionality reduction, kernel methods, manifold learning, latent models, regression, classification, Bayesian methods, maximum entropy methods, real-time tracking, extended Kalman filters, time series prediction, hidden Markov models, factorial HMMs, input-output HMMs, Markov random fields, variational methods, dynamic Bayesian networks, and Gaussian/Dirichlet processes. Links to cognitive science

**COMS W4773 Machine Learning Theory. 3 points.**

Prerequisites: Machine Learning (COMS W4771). Background in probability and statistics, linear algebra, and multivariate calculus. Ability to program in a high-level language, and familiarity with basic algorithm design and coding principles.

Prerequisites: see notes re: points

Core topics from unsupervised learning such as clustering, dimensionality reduction and density estimation will be studied in detail. Topics in clustering: k-means clustering, hierarchical clustering, spectral clustering, clustering with various forms of feedback, good initialization techniques and convergence analysis of various clustering procedures. Topics in dimensionality reduction: linear techniques such as PCA, ICA, Factor Analysis, Random Projections, non-linear techniques such as LLE, IsoMap, Laplacian Eigenmaps, tSNE, and study of embeddings of general metric spaces, what sorts of theoretical guarantees can one provide about such techniques. Miscellaneous topics: design and analysis of data structures for fast Nearest Neighbor search such as Cover Trees and LSH. Algorithms will be implemented in either Matlab or Python.

**COMS W4774 Unsupervised Learning. 3.00 points.**
